Syntax Directed Translation

PRODUCTION	SEMANTIC RULE
$E \rightarrow E_1 + T$	$E.code = E_1.code \parallel T.code \parallel '+'$

Syntax Directed Definition: A CFG together with attributes and rules. Attributes are associated with grammar symbols and rules are associated with productions.

Synthesized Attribute: For a non-terminal A at a parse tree node N synthesized attribute is defined by a semantic rule associated with the production at N .

Inherited Attribute: For a non-terminal B at a parse tree node N inherited attribute is defined by a semantic rule associated with the production at the parent of N .

Evaluation order for SDD

- *Dependency Graph*
- *S-Attributed Definitions:* An SDD is S-attributed if every attribute is synthesized.
- *L-Attributed Definitions:* Each attribute must be either (i) Synthesized or (ii) Inherited with the limited rules.

Homework

Give an SDD to translate infix expression with + and × into equivalent expression without redundant parentheses.

$((a \times (b + (c))) \times (d)) \rightarrow a \times (b + c) \times d$

Encode that × is with higher precedence than +.

Type setting example

E₁.height

A diagram illustrating the typesetting of the expression "E₁.height". The text is enclosed in a blue dashed rectangular box. A vertical blue double-headed arrow on the left side of the box is labeled "height". A horizontal red dashed line extends from the right side of the box, and a vertical red double-headed arrow pointing downwards from this line is labeled "depth".
